1. What are the primary functions of the cerebral cortex?

Answer: The cerebral cortex is responsible for higher-level cognitive functions, including perception, reasoning, problem-solving, and decision-making. It is divided into four lobes: frontal (associated with reasoning and planning), parietal (processing sensory information), temporal (involved in auditory processing and memory), and occipital (responsible for visual processing).

2. Describe the difference between intrinsic and extrinsic motivation.

Answer: Intrinsic motivation refers to engaging in a behavior because it is inherently rewarding, such as pursuing a hobby for the joy it brings. In contrast, extrinsic motivation involves performing a behavior to earn rewards or avoid punishments, such as studying to achieve a good grade.

3. Explain the concept of cognitive dissonance and provide an example.

Answer: Cognitive dissonance is the psychological discomfort experienced when an individual holds two contradictory beliefs or engages in behavior that contradicts their beliefs. 4. What are the stages of sleep, and why are they important?

Answer: Sleep is divided into several stages, including REM (rapid eye movement) and non-REM sleep. Non-REM sleep further consists of stages 1, 2, 3, and 4, which gradually progress from light sleep to deep sleep. These stages are essential for physical restoration, memory consolidation, and emotional regulation.
