- Discussion: Interpretation of results and their implications.

Common Experiments in BSC 2085

The BSC 2085 Lab Manual includes a variety of experiments. Here are some common ones along with a brief explanation of their objectives:

1. Histology Slides

Objective: To familiarize students with various tissue types and their characteristics through examination of prepared histology slides.

Procedure:

- Use a microscope to observe different types of tissues (e.g., epithelial, connective, muscle, and nervous).
- Identify key features of each tissue type and record observations.

2. Blood Typing Experiment

Objective: To understand blood types and the principles of agglutination.

Procedure:

- Mix blood samples with anti-sera to determine blood type through agglutination reactions.
- Record the results and discuss the implications for blood transfusions.

3. Muscle Contraction Lab

Objective: To study the physiological properties of muscle contraction.

Procedure:

- Use a physiological recording device to measure muscle contractions under different stimuli.
- Analyze the effect of varying stimulus intensity on muscle response.
