What is a Mini Split System?

A mini split system is a type of air conditioning system that consists of two main components: an indoor unit and an outdoor unit. The system operates without the need for ductwork, making it ideal for homes where installing ductwork is impractical or too costly.

Key components:

- Indoor Unit: This is the part of the system that distributes conditioned air throughout the space. It can often be mounted on walls, ceilings, or even floor units.
- Outdoor Unit: This component houses the compressor and condenser, which work together to cool or heat the refrigerant that is circulated through the system.

Benefits of Using a Mini Split System

1. Energy Efficiency: Mini splits are known for their high energy efficiency ratings, often resulting in lower utility bills.
2. Zoning Capability: Each indoor unit can be controlled independently, allowing for personalized temperature settings in different rooms.
3. Easy Installation: Without the need for ductwork, installation is less invasive and can often be completed in a day.
