1. Slipping Transmission

One of the most common issues with automatic transmissions is slipping, where the engine revs but the vehicle does not accelerate as expected. This can be caused by low transmission fluid, worn-out clutch packs, or internal damage.

2. Overheating

Overheating can lead to severe transmission damage. Common causes include low fluid levels, a faulty cooler, or debris blocking the cooler lines.

3. Fluid Leaks

Transmission fluid leaks can often lead to slipping and overheating. Common leak points include the pan gasket, seal areas, and cooler lines.

4. Unresponsive Gears

If the transmission does not engage in gear, it could be due to low fluid, a faulty shift linkage, or internal component failure.

Harsh or jerky shifts can indicate a problem with the transmission fluid or the internal components, such as solenoids or valves.
