

# CODON WORKSHEET ANSWER KEY

CODON WORKSHEET ANSWER KEY PROVIDES ESSENTIAL INSIGHTS INTO THE UNDERSTANDING OF GENETIC CODING AND THE TRANSLATION OF NUCLEIC ACIDS INTO PROTEINS. CODONS, WHICH ARE TRIPLET SEQUENCES OF NUCLEOTIDES, PLAY A CRUCIAL ROLE IN THE GENETIC CODING SYSTEM. EACH CODON CORRESPONDS TO A SPECIFIC AMINO ACID OR A STOP SIGNAL DURING PROTEIN SYNTHESIS. IN THIS ARTICLE, WE WILL EXPLORE THE FUNCTION OF CODONS, PROVIDE A DETAILED FRAMEWORK FOR A TYPICAL CODON WORKSHEET, AND OFFER AN ANSWER KEY ALONG WITH EXPLANATIONS TO ENHANCE COMPREHENSION.

## UNDERSTANDING CODONS

### WHAT IS A CODON?

A CODON IS A SEQUENCE OF THREE NUCLEOTIDES THAT TOGETHER FORM A UNIT OF GENETIC CODE IN A DNA OR RNA MOLECULE. THE SEQUENCE OF THESE NUCLEOTIDES ENCODES THE INSTRUCTIONS FOR SYNTHESIZING PROTEINS. EACH OF THE FOUR NUCLEOTIDES—ADENINE (A), CYTOSINE (C), GUANINE (G), AND URACIL (U) IN RNA (OR THYMINE (T) IN DNA)—CAN COMBINE IN VARIOUS WAYS TO FORM DIFFERENT CODONS.

- EXAMPLES OF CODONS:
- AUG: METHIONINE (ALSO THE START CODON)
- UAA: STOP CODON
- GCA: ALANINE

### THE ROLE OF CODONS IN PROTEIN SYNTHESIS

CODONS ARE FUNDAMENTAL TO THE PROCESS OF TRANSLATION, WHERE THE INFORMATION ENCODED IN MESSENGER RNA (mRNA) IS TRANSLATED INTO A SEQUENCE OF AMINO ACIDS TO FORM PROTEINS. THE STEPS INVOLVED IN THIS PROCESS INCLUDE:

1. TRANSCRIPTION: THE DNA SEQUENCE IS TRANSCRIBED TO FORM mRNA.
2. TRANSLATION: THE mRNA IS READ BY RIBOSOMES, WHICH FACILITATE THE BINDING OF TRANSFER RNA (tRNA) MOLECULES THAT CARRY SPECIFIC AMINO ACIDS.
3. POLYPEPTIDE FORMATION: AMINO ACIDS ARE LINKED TOGETHER IN THE ORDER SPECIFIED BY THE CODONS IN THE mRNA, FORMING A POLYPEPTIDE CHAIN THAT EVENTUALLY FOLDS INTO A FUNCTIONAL PROTEIN.

## SECTION C: RECOGNIZING STOP CODONS ANSWERS

- A)
  - SEQUENCE: UGG UAA CCA
  - STOP CODON: UAA
  - SIGNIFICANCE: UAA SIGNALS THE TERMINATION OF PROTEIN SYNTHESIS, INDICATING THAT THE RIBOSOME SHOULD STOP ADDING AMINO ACIDS.
- B)
  - SEQUENCE: AUG UAA GCG UAG
  - STOP CODON: UAA, UAG
  - SIGNIFICANCE: BOTH UAA AND UAG ARE STOP CODONS THAT SIGNAL THE END OF THE TRANSLATION PROCESS, ENSURING THE PROTEIN CHAIN IS COMPLETED.

## SECTION D: CODON CHART REFERENCE

A CODON CHART IS A VITAL TOOL FOR STUDENTS TO DECODE mRNA SEQUENCES INTO AMINO ACIDS. HERE IS A SIMPLIFIED VERSION OF THE CHART:

- START CODON: AUG (METHIONINE)
- STOP CODONS: UAA, UAG, UGA
- EXAMPLE CODONS:
  - UUU: PHENYLALANINE
  - AAG: LYSINE
  - GGC: GLYCINE

## BONUS QUESTION ANSWER

THE START CODON (AUG) IS CRUCIAL IN THE PROCESS OF TRANSLATION AS IT MARKS THE BEGINNING OF PROTEIN SYNTHESIS. IT NOT ONLY SIGNIFIES WHERE THE RIBOSOME SHOULD START READING THE mRNA BUT ALSO ENCODES THE AMINO ACID METHIONINE, WHICH IS THE FIRST AMINO ACID IN THE MAJORITY OF NEWLY SYNTHESIZED PROTEINS. RECOGNIZING THE START CODON IS VITAL FOR ACCURATE PROTEIN FORMATION AND FUNCTION.
